

**THE FACTORIES AND OTHER PLACES OF WORK ACT,  
(CAP. 514)**

**IN EXERCISE** of the powers conferred by section 55 of the Factories and Other Places of Work Act, Cap. 514, the Minister for Labour and Human Resource Development makes the following Rules—

**THE FACTORIES AND OTHER PLACES OF WORK  
(HAZARDOUS SUBSTANCES) RULES, 2007**

Citation.

1. These rules may be cited as the factories and other places of work (Hazardous Substances) rules, 2007.

Interpretation.

2. In these rules, except where the context otherwise requires—

“air quality monitor” means any competent person who is authorized by the director, by a certificate in writing, to carry out monitoring and measurements of the substances in the air.

“biological monitoring” means a technique for measuring the presence of a chemical or its metabolites in tissues or excreta or for measuring pathological effects of toxin on the person.

“competent person” in relation to any duty or function, means a person who has adequate training, relevant qualifications and experience to enable him to perform that duty or function;

“designated sites” means a site designated or zoned by Local Authority for use of that purpose.

“Director” means the Director of Occupational Safety and Health Services;  
or occupier.

“employer” includes owner and / or occupier.

“Engineering Controls Examiner” means any competent person who is authorized by the Director in writing, to carry out thorough examination and test of engineering control measures for the purposes of these rules.

“ guidelines” means the guidelines describing the methodology for implementation of health and safety under these Rules ;

“harmful substance” means any substance whether liquid, solid or gaseous which is hazardous or potentially hazardous to human or the environment and includes objectionable odours, radio-activity, noise and temperature.

“hazardous substances” means any chemical, waste, gas, medicine, drug, plant, animal or microorganism which are likely to be injurious to human health or the environment,

“measurement” means periodic evaluation of workplaces and organizational management systems in a factory or workplace for prevention of accidents, occupational diseases, ill-health or damage to property.

“ occupational exposure limit” (OEL) means the levels of exposure or discharge or emissions as set out in Schedule 1 to these Rules;

“worker” includes a person who has entered into or works under a contract of service or apprenticeship, written or oral, express or implied, whether by way of manual labour or otherwise;

“workplace” includes any land, premises,

location, vessel or thing at, in, upon or near where an employee is, in the course of employment.

“substance” includes any solid, liquid, vapour, gas or aerosol, or combination thereof;

Application.

**3.** These Rules shall apply to—

(1) Every factory, premises, places, process, operation, or work to which the provisions of the Factories and Other Places of Work Act apply;

(2) Every employer, occupier or owner, agent, self-employed person or employee

Shared responsibilities by employers

**4.** Whenever two or more employers, self-employed persons or their agents undertake activities simultaneously at one workplace, they shall have the duty to collaborate in order to comply with the prescribed measures without prejudice to the responsibility of each employer for the health and safety of his employees.

Exposure limits.

**5** (1). Every employer shall ensure that exposure of hazardous substance does not exceed the exposure limits set out in schedule 1 to these Rules;

(2) Where the exposure limit of a hazardous substance is not provided for in Schedule 1 to these Rules, it shall be the responsibility of a supplier or manufacturer of such substance to provide a provisional exposure limit.

(3) When two or more hazardous substances are present simultaneously in the working atmosphere and their combined effects have to be considered, Schedule 2 to these Rules shall apply

(4) The Government Chemist or any other laboratory approved by the director shall carry sample analysis of hazardous substances and biological samples to determine exposure levels and biological exposure indices respectively.

Amendment  
of Schedules

6. The Minister may, on the advice of the Director, by notice in the Gazette, amend the Schedules to—

- (a) vary the exposure limit ;
- (b) prohibit the use of a hazardous substance that may contaminate the working environment;
- (c) specify particular measures of prevention or protection from the effects of a hazardous substance; or
- (d) prescribe any other exposure limit of a hazardous substance.

Control measures.

7. (1) It shall be the duty of every employer to prevent his employees from being exposed to hazardous substance.

(2) Where it is not reasonably practical to prevent the exposure, it shall be the duty of every employer to control the exposure of employees from hazardous substances by-

- (a) limiting the amount of hazardous substances used which may contaminate the working environment;

- (b) limiting the number of employees who will be exposed or may be exposed;
- (c) using a substitute for the hazardous substance;
- (d) limiting the period during which an employee will be exposed or may be exposed;
- (e) introducing engineering control measures for the control of exposure, which may include the following:
  - (i) process separation, automation or enclosure;
  - (ii) installation of local extraction ventilation systems to processes, equipment and tools for the control of emission of an air borne hazardous substances;
  - (iii) use of wet methods;
  - (iv) separate workplaces for different processes;
- (f) introducing appropriate work procedures which an employee must follow where materials are used or processes are carried out which could give rise to exposure of an employee and that procedures shall include written instructions to ensure:
  - (i) that a hazardous substance is safely handled, used and disposed of;

(ii) that process machinery, installations, equipment, tools and local extraction and general ventilation systems are safely used and maintained;

(iii) that machinery and workplaces are kept clean; and

(iv) that early procedures are in place for corrective action.

Personal protective equipment.

**8** (1). Where it is not reasonably practical to ensure that the exposure of an employee is adequately controlled as contemplated in Rules 7, the employer shall-

(a) in the case of an air borne hazardous substances, provide the employee with suitable respiratory protective equipment and protective clothing; and

(b) in case of hazardous substances which can be absorbed through the skin, provide the employee with suitable impermeable protective equipment.

(2) Where respiratory protective equipment is provided, the employer shall ensure-

(a) that the relevant equipment is capable of controlling the exposure to below the occupational exposure limit for the relevant hazardous substances

(b) that the relevant equipment is correctly selected and properly used;

- (c) that information, instructions, training and supervision which is necessary with regard to the use of the equipment is known to the employees; and
- (d) that the equipment is kept in good condition and efficient working order.

(3). Every employer shall, -

- (a) issue unused personal protective equipment to an employee, unless the relevant protective equipment is decontaminated and sterilized;
- (b) provide separate containers or storage facility for personal protective equipment ; and
- (c) ensure that all personal protective equipment not in use is stored only in the place provided.

(4) Every employer shall ensure that all contaminated personal protective equipment is cleaned and handled in accordance with the following procedures:

- (a) where the equipment is cleaned on the premises of the employer, care shall be taken to prevent contamination during handling, transportation and cleaning;
- (b) where the equipment is sent out the premises to a contractor for cleaning purposes-
  - (i) the equipment shall be packed in

impermeable containers;

- (ii) the containers shall be tightly sealed and have clear indication thereon that the contents thereof are contaminated; and
- (iii) the relevant contractor shall be fully informed of the requirements of these rules and the precautions to be taken for the handling of the contaminated equipment.

(5) Subject to the provisions of sub rule 4 (b), an employer shall ensure that no person removes dirty or contaminated personal protective equipment from the premises; Provided that where contaminated personal protective equipment has to be disposed of, it shall be treated as waste .

(6) Every employer shall, , provide employees using personal protective equipment with : -

- (a) adequate washing facilities which are readily accessible and located in a an area where the facilities will not become contaminated, in order to enable the employees to meet a standard of hygiene consistent with the adequate control of exposure, and to avoid the spread of hazardous substances
- (b) two separate lockers separately labeled “Protective clothing” and “Personal clothing”, and ensure that the clothing is kept separately in the appropriate locker ; and

- (c) separate “clean” and “dirty” changing rooms if the employer uses or processes hazardous substances to the extent that the hazardous substances could endanger the health of employees.

Maintenance and testing of engineering controls.

**9. Every employer shall ensure:**

(1) That all control equipment and facilities provided are maintained in good working order; and

(2) That thorough examinations and tests of engineering control measures are carried out at intervals not exceeding 24 months by an engineering controls examiner and a report issued.

Submission of report.

**10** An engineering controls examiner shall submit a signed report to the Director within thirty days following such examination and test.

Protection against radioactive and carcinogenic substances.

**11.(1)** Every employer shall ensure that any processes involving a significant risk of exposure to carcinogenic, radioactive, mutagenic or teratogenic substances shall be performed within an enclosed system so as to prevent any exposure of the workers to the substance.

(2) Where any of the processes may involve use of carcinogenic, radioactive, mutagenic or teratogenic substances, every employer shall ensure that such processes are automated or are conducted by use of remote controlled systems.

(3) Every employer shall issue a permit to work certificate to any person carrying out maintenance and service of an enclosed system.

Material Safety Data Sheet.

**12.**(1).Every manufacturer or agent of hazardous substances shall supply information on the characteristics of such substances as regards to the health effects of the substances. on human health.

(2)Every person who manufactures, imports, sells or supplies any hazardous substance for use at work, shall ensure that the substance is accompanied by a material safety data sheet containing all the information set out in schedule 3 to these Rules:

(3)Every employer who uses any hazardous substance at work shall be in possession of a copy of material safety data sheet for each type of substance in use at his premises.

(4)Every employer shall make the material safety data sheet available for inspection at the request of any person interested or affected.

(5) Every employer shall provide full information on the composition and properties of a product to the Director, when called upon to do so.

Disposal of hazardous substances.

**13.** Every employer shall ensure that the quantity of waste from hazardous substances in his use are kept at reasonable minimum levels and that such waste is disposed of in a manner less harmful to human and the environment, including-

- (a) recycling the waste material where applicable;
- (b) depositing of hazardous waste substances into containers that will prevent the likelihood of exposure during handling;
- (c) ensuring that all vehicles, re-usable containers and covers which have been

in contact with hazardous waste substances are cleaned and decontaminated after use in such a way that the vehicle, containers or covers do not cause a hazard to human and environment.

- (d) ensuring that all employees employed in the collection, transportation and disposal of harmful waste substances are not exposed to the harmful waste and are provided with suitable personal protective equipment;
- (e) ensuring that all hazardous waste substances is disposed off only on specifically designated sites for this purpose.

Labeling of containers.

**14.** (1) Every manufacturer or supplier of hazardous substances shall ensure that the hazardous substance is marked or labeled in a distinctive manner indicating the nature of their contents, health hazards and instructions for safe handling of the substance .

(2)Every manufacturer or supplier of a hazardous substance shall ensure that the chemical or common name used to identify the chemical on the label shall be the same as that used on the material safety data sheet.

Training and Information.

**15.**(1) It shall be the duty of every employer to inform the workers of the hazards associated with exposure to chemicals used at the workplace and every employer shall facilitate the training of his worker on safety by-

- (a) instructing the workers how to

obtain and use the information provided on labels and chemical safety data sheets;

- (b) using the chemical safety data sheets, along with information specific to the workplace, as a basis for the preparation of instructions to workers, which should be written if appropriate;

(2) Every employer shall ensure that workers are trained and certified by a competent person, on continuing basis in the practices and procedures to be followed for safety in the use of chemicals at work.

(3) Every employer shall, before any employee is exposed, ensure that the employee is adequately and comprehensively informed and trained, and is thereafter informed and trained at intervals as may be recommended by the health and safety committee or by the Director, with regard to-

- (a) the contents and scope of these rules;
- (b) the potential source of exposure;
- (c) the potential risks to health caused by exposure
- (d) the potential detrimental effects of exposure on his or her reproductive ability;
- (e) the measure to be taken by the employers to protect an employee against any risk from exposure;
- (f) the precaution to be taken by an employee to protect himself against the health risks

associated with the exposure, including the wearing and use of protective clothing and respiratory protective equipment;

- (g) the necessary, correct use, maintenance and potential of safety equipment, facilities and engineering control measures provided;
- (h) the necessity of personal air sampling and medical surveillance ;
- (i) the importance of good housekeeping at the workplace and personal hygiene;
- (j) the safe working procedures regarding the use, handling, storage and labeling of the chemical and other hazardous substance at the workplace; and
- (k) procedures to be followed in the event of spillages, leakages or any similar emergency situation which could take place by accident;

(4) Every employer shall give written instructions to the drivers of vehicles carrying the hazardous substances, the procedures to be followed in the event of spillages, leakages or any similar emergency situation which could take place by accident.

Air monitoring and Measurement.

**16. (1)** In every workplace where hazardous substances are used the employer shall ensure that measurements of the substances in the air are carried out at least once every twelve months by a certified air quality monitor , in order to determine the prevailing occupational exposure levels.

(2) The costs in connection with such measurements shall be met by the employer.

(3) The results of measurement of the substances in the air shall be recorded and shall specify: -

- (a) date, time and period of sampling
- (b) nature of work/process evaluated
- (c) number of the workers exposed
- (d) measuring methods including analytical methods
- (e) type of measurements (e.g. dust, fumes, vapors....)
- (f) results of measurements
- (g) recommendations for remedial measures to be taken
- (h) name of the person taking the measurements.

(4) Every employer shall keep a copy of the report of the results of measurements carried out for a period of two years.

(5) An Air Quality Monitor shall submit a signed copy of the report of the results of measurements to the director within a period of thirty days from the date of carrying out the measurements.

(6) Where the Air Quality Monitor is of the opinion that occupational exposure levels pose imminent danger to workers' health he shall immediately and not later than 48 hours, inform the Occupational Safety and Health officer of the area.

Duty of competent persons.

**17.(1)** Every Air Quality Monitor shall regularly inspect, calibrate and maintain equipment for measuring air contaminants.

(2) It shall be the duty of a competent person to carry out biological monitoring with the consent of the employee.

(3) A competent person shall inform employees on the scope of biological monitoring and on the significance of the results;

Guidelines on hazardous substances.

**18.** The director may review and issue guidelines, on how the monitoring of air contaminants shall be carried out.

Duty of Employees.

**19.** It shall be the duty of every employee-

(a) not to interfere with or misuse any means, appliance, convenience or any other thing provided for securing the health, safety or welfare of him or others at the workplace;

(b) to make use of any means, appliance, convenience or any other thing provided for securing the health, safety or welfare of himself or others at the workplace;

- (c) not to, without reasonable cause do anything likely to endanger himself or any other person at the workplace;
- (d) to report forthwith to the supervisor or any other person having authority over him, any situation which he has reason to believe would present a hazard; and
- (e) to report to his supervisor any accident or injury that arises in the course of or in connection with his work.

Medical examination.

**19.** In every workplace where hazardous substances are in use, the employer shall ensure that the worker undergoes medical examination in accordance with the requirements of the Factories and Other Places of Work (Medical Examination) Rules, 2005.

Offences and penalties.

**20.** Any person who contravenes or fails to comply with any provision of these rules shall commit an offence and the provisions of the Act on offences and penalties shall mutatis mutandis apply.

**THE FACTORIES AND OTHER PLACES OF WORK  
(HAZARDOUS SUBSTANCES) RULES, 2007**

SCHEDULE 1

rule 5(1)

TABLE 1  
OEL-CL: OCCUPATIONAL EXPOSURE LIMITS –  
CONTROL LIMITS FOR HAZARDOUS CHEMICAL  
SUBSTANCES

Substance	Formula	TWA OEL-CL		SHORT TERM OEL-CL		1995
		ppm	mg/m <sup>3</sup>	ppm	mg/m <sup>3</sup>	Notes
Acryl amide	CH <sub>2</sub> =CHCONH <sub>2</sub>	-	0.3	-	-	Sk
Acrylonitrile	CH <sub>2</sub> =CHCN	2	4	-	-	Sk
Arsenic & compounds, except arsine (as As) *Asbestos (see note)	As	-	0.1	-	-	
Benzene	C <sub>6</sub> H <sub>6</sub>	5	16	-	-	-
Bis (chloromethyl) ether (BCME)	ClCH <sub>2</sub> OCH <sub>2</sub> Cl	0.00 1	0.005	-	-	
Buta-1,3-diene	CH <sub>2</sub> =CHCH=CH <sub>2</sub>	10	22	-	-	
2-Butoxyethanol	C <sub>4</sub> H <sub>9</sub> OCH <sub>2</sub> CH <sub>2</sub> OH	25	120	-	-	Sk
Cadmium & cadmium compounds, except cad- mium oxide fume and cadmium sulphide pig- ments (as Cd)	Cd	-	0.05	-	-	
Cadmium oxide fume (as Cd)	CdO	-	0.05	-	0.05	
Cadmium sulphide pigments (respirable dust Cd)	CdS	-	0.04	-	-	
Carbon disulphide	CS <sub>2</sub>	10	30	-	-	Sk
Chromium compounds (as Cr)	Cr	-	0.05	-	-	

1,2-Dibromoethane (ethylene dibromide)	BrCH <sub>2</sub> CH <sub>2</sub> Br	0.5	4	-	-	Sk
Dichloromethane	CH <sub>2</sub> Cl <sub>2</sub>	100	350	-	-	
2,2'-Dichloro-4,4' methylene dianiline (MBOCA)	CH <sub>2</sub> .(C <sub>6</sub> H <sub>3</sub> ClNH <sub>2</sub> ) <sub>2</sub> .	-	0.005	-	-	Sk
2-Ethoxyethanol	C <sub>2</sub> H <sub>5</sub> OCH <sub>2</sub> CH <sub>2</sub> OH	10	37	-	-	Sk
2-Ethoxyethyl acetate	C <sub>2</sub> H <sub>5</sub> OCH <sub>2</sub> OOCCH <sub>3</sub> .	10	54	-	-	Sk
Ethylene oxide	CH <sub>2</sub> CH <sub>2</sub> O	5	10	-	-	
Formaldehyde	HCHO	2	2.5	2	2.5	
*Grain dust		-	10	-	-	Sen
Hydrogen cyanide	HCN	-	-	10	10	Sk
Isocyanates, all (as-NCO)		-	0.02	-	0.07	Sen
*Lead and compounds						
2-Methoxyethanol	CH <sub>3</sub> OCH <sub>2</sub> CH <sub>2</sub> OH	5	16	-	-	Sk
2-Methoxyethyl acetate	CH <sub>3</sub> COOCH <sub>2</sub> CH <sub>2</sub> O CH <sub>3</sub>	5	24	-	-	Sk
Nickel	Ni	-	0.5	-	-	
Nickel, inorganic compounds (as Ni)	Ni	-	0.1	-	-	
soluble compounds		-	0.5	-	-	
insoluble compounds		-		-	-	
Rubber process dust		-	8	-	-	
Rubber fume		-	0.6	-	-	
Silica, crystalline	SiO <sub>2</sub>					
respirable dust		-	0.4	-	-	
Styrene	C <sub>6</sub> H <sub>5</sub> CH=CH <sub>2</sub>	100	420	250	1050	
1,1,1-Trichloroethane	CH <sub>3</sub> CCl <sub>3</sub>	350	1900	450	2450	
Trichloroethylene	CCl <sub>2</sub> =CHCl	100	535	150	802	Sk
**Vinyl chloride	CH <sub>2</sub> =CHCl	7	-	-	-	
Vinylidene chloride	CH <sub>2</sub> =CCl <sub>2</sub>	10	40	-	-	
Wood dust (hard wood)		-	5	-	-	Sen

**\*Note**

**(a) The concentration of "respirable dust" shall be determined from the fraction passing a size selector with an efficiency that will allow-**

- (a) 100% particles of 1 µm aerodynamic diameter,
- (ii) 50% particles of 5 µm aerodynamic diameter,
- (iii) 20% particles of 6 µm aerodynamic diameter,
- (iv) 0% particles of 7 µm aerodynamic diameter.

**(b) Asphyxiant substances.**

1. Some gases and vapours, when present at high concentration in air, act as simple Asphyxiants by reducing the oxygen content by dilution to such an extent that life cannot be supported. Many asphyxiants are odourless, colourless and not readily detectable. Monitoring the oxygen content of the air is often the best means of ensuring safety. The oxygen content of air in the workplace should never be allowed to fall below a minimum of 18% by volume under normal atmospheric pressure. Particular care is necessary when dense asphyxiants e.g. argon are used, since very high localised concentrations can arise owing to their collecting in pits, confined spaces and other low lying areas where ventilation is likely to be poor.
2. Many asphyxiants present a fire or explosion risk. The concentration at which these risks can arise are liable to be well below those levels at which asphyxiation is likely to occur and should be taken in to account when assessing the hazards.

**(c) OEL for asbestos**

- Amosite 0.5 fiber > 5µm/cc
- Chrysolite 2 fibers > 5µm/cc
- Crocidolite 0.2 fiber > 55µm/cc
- Other forms 2 fiber > 5µm/c

**(d) OEL for Lead and its compounds**

- Lead 0.15 mg/m<sup>3</sup>
- Tetra-ethyl Lead 0.10 mg/m<sup>3</sup>

\*\*Vinyl chloride is also subject to an overriding annual TWA OEL- CL of 3 ppm.

\* The OEL-RL for aluminium does not include exposure to aluminium coated with mineral oil or to fume arising from aluminium welding processes.

### Abbreviations

1. *OEL-CL*: Occupational Exposure Limit-Control Limit.
2. *OEL-RL*: Occupational Exposure Limit-Recommended Limit.
3. *ppm*: Parts per million.
4. *mg/m<sup>3</sup>*: milligrams per cubic metre.
5. *Sk*: Skin absorption.
6. *Sen*: capable of causing respirable sensitisation.
7. *ISO*: International Standards Organization

TABLE 3  
BIOLOGICAL EXPOSURE INDICES (BEI)

CHEMICAL DETERMINANT	SAMPLING TIME	BEI	Notation*
ANILINE			
Total p-aminophenol in urine	End of shift	50 mg/g creatinine	C
Methemoglobin in blood	During or end of shift	1.5% of hemoglobin	B,C,D
ARSENIC AND SOLUBLE COMPOUNDS INCLUDING ARSINE			
Inorganic arsenic metabolites in urine	End of workweek	50 µg/g creatinine	B
BENZENE			
Total phenol in urine	End of shift	50 mg/g creatinine	B,C

Benzene in exhaled air:	Prior to next shift		
mixed-exhaled		0.08 ppm	D
end-exhaled		0.12 ppm	D
CADMIUM			
Cadmium in urine	Not critical	1.0 µg/g creatinine	B
Cadmium in blood	Not critical	1.0 µg/l	B
CARBON DISULFIDE			
2-Thiothiazolidine-4-carboxylic acid in urine	End of shift	5 mg/g creatinine	
CARBON MONOXIDE			
Carboxyhemoglobin in blood	End of shift	less than 8% of hemoglobin	B,C
Carbon monoxide in end-exhaled air	End of shift	less than 40 ppm	B,C
CHLOROBENZENE			
Total 4-chlorocatechol in urine	End of shift	150 mg/g creatinine	C
Total p-chlorophenol in urine	End of shift	25 mg/g creatinine	C
CHROMIUM (VI),			
Water soluble fume	Increase during shift	1.0 µg/g creatinine	B
Total chromium in urine	End of shift at end of workweek	30 µg/g creatinine	B
N,N-DIMETHYLFORMAMIDE (DMF)			
N-Methylformamide in urine	End of shift	40 mg/g creatinine	B
ETHYL BENZENE			
Mandelic acid in urine	End of shift at end of workweek	1.5 g/g creatinine	A
Ethyl benzene in end-exhaled air			D
FLUORIDES			
Fluorides in urine	Prior to shift	3 mg/g creatinine	B,C
	End of shift	10 mg/g creatinine	B,C
FURFURAL			
Total furoic acid in urine	End of shift	200 mg/g creatinine	B,C
n-HEXANE			
2,5-Hexanedione in urine	End of shift	5 mg/g creatinine	C
n-Hexane in end-exhaled air			D
MERCURY			
Total inorganic mercury in urine	Prior to shift	35 µg/g creatinine	B
Total inorganic mercury in blood	End of shift at end of workweek	15 µg/l	B
METHEMOGLOBIN INDUCERS			
Methemoglobin in blood	During or end of	1.5% of hemoglobin	B,C,D

METHANOL	shift		
Methanol in urine	End of shift	15 mg/l	B,C
Formic acid in urine	Before shift at end of workweek	80 mg/g creatinine	B,C
METHYL CHLOROFORM			
Methyl chloroform in end-exhaled air	Prior to the last shift of workweek	40 ppm	
Trichloroacetic acid in urine	End of workweek	10 mg/l	C,D
Total trichloroethanol in urine	End of shift at end of workweek	30 mg/l	C,D
Total trichloroethanol in blood	End of shift at end of workweek	1 mg/l	C
METHYLETHYLKETONE			
MEK in urine	End of shift	2 mg/l	-
METHYL ISOBUTYL KETONE			
MIBK in urine	End of shift	2mg/l	-
NITROBENZENE			
Total p-nitrophenol in urine	End of shift at end of workweek	5 mg/g creatinine	C
Methemoglobin in urine	End of shift	1.5% of hemoglobin	B,C,D
ORGANOPHOSPHORUS CHOLINESTERASE INHIBITORS			
Cholinesterase activity in red cells	Discretionary	70% of individual's baseline	B,C,D
PARATHION			
Total p-nitrophenol in urine	End of shift	0.5 mg/g creatinine	C,D
Cholinesterase activity in red cells	Discretionary	70% of individual's baseline	B,C,D
PENTACHLOROPHENOL			
Total PCP in urine	Prior to the last shift of workweek	2 mg/g creatinine	B
Free PCP in plasma	End of shift	5 mg/l	B
PERCHLOROETHYLENE			
Perchloroethylene in end-exhaled air	Prior to the last shift of workweek	10ppm	
Perchloroethylene in blood	Prior to the last	1 mg/l	

Trichloroacetic acid in urine	shift of workweek	End of workweek	7 mg/l	C,D
PHENOL				
Total phenol in urine		End of shift	250 mg/g creatinine	B,C
STYRENE				
Mandelic acid in urine		End of shift	800 mg/g creatinine	C
		Prior to next shift	300 mg/g creatinine	C
Phenylglyoxylic acid in urine		End of shift	240 mg/g creatinine	B,C
		Prior to next shift	100 mg/g creatinine	B,C
Styrene in venous blood		End of shift	0.55 mg/l	D
		Prior to next shift	0.02 mg/l	D
TOLUENE				
Hippuric acid in urine		End of shift	2.5 g/g creatinine	B,C
Toluene in venous blood		End of shift	1 mg/l	D
o-Cresol in urine		End of shift	1 mg/g creatinine	C
TRICHLOROETHYLENE				
Trichloroacetic acid in urine		End of workweek	100 mg/g creatinine	C
Trichloroacetic acid and trichloroethanol in urine		End of shift at end of workweek	300 mg/g creatinine	C
Free trichloroethanol in blood		End of shift at end of workweek	4 mg/l	C
Trichloroethylene in end-exhaled air			D	
XYLENE				
Methylhippuric acid in urine		End of shift	1.5 g/g creatinine	
		last four hours of shift	2 mg/min	-

\*Notations

“A” notation: This notation indicates that an identifiable population group might have an increased susceptibility to the effect of the chemical, thus leaving it unprotected by the recommended BEI.

“B” notation: This notation indicates that the determinant is usually present in a significant amount in biological specimens collected from subjects who have not been occupationally exposed. Such background levels are included in the BEI value.

“C” notation: This notation indicates that the determinant is non-specific, since it is observed after exposure to some other chemicals. These non-specific tests are preferred because they are easy to use and usually offer a better correlation with exposure than specific tests. In such instances a BEI for a specific, less quantitative biological determinant is recommended as a confirmatory test.

“D” notation: This notation indicates that the biological determinant is an indicator of exposure to the chemical, but the quantitative interpretation of the measurement is ambiguous (semi-quantitative). These biological determinants should be used as a screening test if a quantitative test is not practical or a confirmatory test if the quantitative test is not specific and the origin of the determinant is in question.

*Applying occupational exposure limits*

## 1. General

The lists of occupational exposure limits given in Tables 1 and 2 unless otherwise stated, relate to personal exposure to substances hazardous to health in the air of the workplace.

2 *Units of measurement*

(2.1) In occupational exposure limits, concentrations of gases and vapour in air are usually expressed in parts per million (ppm), a measure of concentration by volume, as well as in milligrams per cubic meter of air ( $\text{mg}/\text{m}^3$ ), a measure of concentration by mass.

(2.2) In converting from ppm to  $\text{mg}/\text{m}^3$  a temperature of  $25^\circ\text{C}$  and an atmospheric pressure of 101,325 KPa are used. Concentrations of airborne particles (fume, dust, etc) are usually expressed in  $\text{mg}/\text{m}^3$ . i.e.  $\text{ppm} = \frac{24.45}{\text{Molecular weight of the substance}} \text{mg}/\text{m}^3$

$$\text{mg}/\text{m}^3 = \frac{\text{molecular weight of the substance}}{24.45} \text{ppm}$$

(2.3) In the case of dust, the limits in the tables refer to the *total inhalable* fraction unless specifically indicated as referring to the *respirable* fraction.

(2.4) In the case of a man-made mineral fiber, the limit is expressed as fibers per milliliter of air ( $\text{fibres}/\text{ml}^l$ ).

3. *Occupational exposure limits- control limits: OEL-CL (Table I)*

(3.1) An OEL-CL is the maximum concentration of an airborne substance, averaged *over* a reference period, to which employees may be exposed by

inhalation under any circumstances, and is specified together with the appropriate reference period in Table 1.

- (3.2) Rule 5 of these rules, imposes a duty on the employer to take all reasonable precautions and to exercise all due diligence to ensure that exposure is kept as *far* below an OEL-CL as is reasonably practicable.

#### 4 Occupational exposure limits – Recommended limit OEL-RL Table 2

- (4.1) An OEL-RL is the concentration of an airborne substance, averaged over a reference period, at which, according to current knowledge, there is no evidence that it is likely to be injurious to employees if they are exposed by inhalation, day after day, to that concentration.
- (4.2) For a substance, which has been assigned an OEL-RL, exposure by inhalation should be reduced to that standard.
- (4.3) Control of an OEL-RL as prescribed in regulation 7(1) can always be regarded as adequate control of that substance for the purposes of these rules, so far as exposure from inhalation is concerned. However, due to the variations in process control and the fluctuations in substance concentrations in the workplace, it will be prudent for employers to reduce exposure below an OEL-RL so as to ensure that the exposure of all employees does not exceed that OEL-RL. Similarly, it is not intended that the statutory requirements under regulation 7(1) should discourage the further application of good occupational hygiene principles in order to reduce exposure below the OEL-RL.

#### 5 Long-term and short-term exposure limits

- (5.1) The pattern of effects due to exposure to substances hazardous to health varies considerably depending on the nature of the substance and the exposure. Some effects require prolonged or accumulated exposure.
- (5.2) The long-term (8-hour time weighted average) exposure limit is intended to control such effects by restricting the total intake by inhalation over one or more work shifts. Other effects may be seen after brief exposures, which have occurred once or repeatedly.
- (5.3) Short-term limits (usually 15 minute) may be applied to such substances. Where long-term limits also apply, the short-term limits restrict the magnitude of excursion above the average concentration during longer exposures. For those substances for which no short-term limit is specified, it is recommended that a figure of three times the long-term limit be used as a guideline for controlling short-term excursions in exposure.

(5.4) With some other substances, brief exposure may be critical and the exposure limit necessary to prevent these excursions will also controls any other effects. A separate long-term limit is not considered necessary in such cases and the short-term limit applies throughout the shift.

(5.4) Exposure limits are expressed as airborne concentrations averaged over a specified period of time. The period for the long-term limit is normally eight hours. When a different period is used, this is stated. The averaging period for the short-term exposure limit is normally 15 minutes. Such a limit applies to any 15-minute period throughout the working shift.

## 6 Limitations to the application of exposure limits

(6.1) The exposure limits relate to personal exposure with the exception of the annual OEL-CL for vinyl chloride, which should be recorded as the time weighted average of vinyl chloride in the atmosphere of a working place over a period of one year. The OEL-RL for cotton dust is not a personal exposure standard, but a static air standard.

(6.2) The limits cannot readily be extrapolated to evaluate or control non-occupational exposure, e.g. levels of contamination in the neighborhood dose to an industrial plant. OELs only apply to persons at work. Employers should also take into account their duties under the Environmental Management and co-ordination Act (EMCA).

(6.3) The OELs are also only approved for use where the atmospheric pressure is between 85 KPa and 101,325 KPa. This covers the normal range of meteorological variations and slightly pressurized workplaces such as cleaning rooms, but not the higher pressures that may be encountered in, for example, tunneling or underwater hyperbaric chambers. Such situations require special assessments.

(6.4).Occupational exposure limits, as set out in Tables 1 and 2 are intended to be used for normal working conditions in workplaces. OELs are not, however, designed to deal with serious accidents or emergencies, particularly where employees may be exposed to rapidly rising concentrations of gas, as may arise from a major escape due to plant failure.

(6.5) Over and above the employers' responsibilities to ensure that the requirements of these rules are met, they also have a clear responsibility to ensure that the plant is designed, operated and maintained in a way that avoids accidents and emergencies. Where appropriate, detection, alarm and response

measures should be used in order to minimize the effect of any such unplanned events.

- (6.6) To help maintain adequate operational control, employers may find it helpful to select their own indicators of control when undertaking investigations or corrective action.

## 7 Pesticides

Substances used as active ingredients in pesticides are listed under their chemical names and/or their common (ISO) names. These names may sometimes be used as parts of the names of proprietary pesticide formulations. In all cases the exposure limit applies to the specific active ingredients and not to the formulation as a whole.

## 8 Dusts

The general approach necessary to control occupational exposure to dusts is as follows:

- (8.1) Not all dusts have been assigned occupational exposure limits but the lack of such limits should not be taken to imply an absence of hazard. In the absence of a specific exposure limit for a particular dust, exposure should be adequately controlled.
- (8.2) Where there is no indication of the need for a lower value, personal exposure should be kept below both 10 mg/m<sup>3</sup> 8-hour time-weighted average total inhalable dust and 5 mg/m<sup>3</sup> time weighted average respirable dust. Such, or greater, dust concentrations should be taken as the *substantial concentrations*.
- (8.3) A *substantial* concentration of dust should be taken as a concentration of 10 mg/m<sup>3</sup>, 8-hour time weighted average, of total inhalable dust or 5 mg/m<sup>3</sup>, 8-hour time-weighted average, of respirable dust, where there is no indication of the need for a lower value, and as such they are referred to as *substances hazardous to health*.

## 9. Total inhalable dust and respirable dust

- (9.1) *Total inhalable dust* approximates to the fraction of airborne material that enters the nose and mouth during breathing and is therefore available for deposition in the respiratory tract.
- (9.2) *Respirable dust* approximates to the fraction, which penetrates to the gas exchange region of the lung.

- (9.3) Where dusts contain components, which have their own assigned occupational exposure limits, all the relevant limits should be complied with.

#### 10 *Fume*

- (10.1) Where a separate OEL has been set for *fume*; it should normally be applied to solid particles generated by chemical reactions or condensed from the gaseous state, usually after volatilization from melted substances.
- (10.2) The generation of fume is often accompanied by a chemical reaction such as oxidation or thermal breakdown.

#### 11 *Absorption through the skin*

- (11.1) In general, for most substances the main route of entry into the body is by inhalation. The OELs given in these regulations solely relate to exposure by this route.
- (11.2) Certain substances such as phenol, aniline and certain pesticides (marked in the Tables with an *SK* notation) have the ability to penetrate the intact skin and thus become absorbed into the body.
- (11.3) Absorption through the skin can result from localized contamination, for example from a splash on the skin or clothing, or in certain cases from exposure to high atmospheric concentrations of vapour.
- (11.4) Serious effects can result in little or no warning and it is necessary to take special precautions to prevent skin contact when handling these substances.
- (11.5) Where the properties of the substances and the methods of use provide a potential exposure route via skin absorption; these factors should be taken into account in determining the adequacy of the control measures.

#### 12 *Sensitizers*

- (12.1) Certain substances may cause sensitization of the respiratory tract if inhaled or skin contact occurs.
- (12.2) Respiratory sensitizers can cause asthma, rhinitis, or extrinsic allergic alveolitis.

- (12.3) Skin sensitizers cause allergic contact dermatitis. Substances, which cause skin sensitizations, are not necessarily respiratory sensitizers or vice-versa.
- (12.4) Only a proportion of the exposed population will become sensitized, and those who do become sensitized, will not have been identified in advance. Individuals who become sensitized may produce symptoms of ill health after exposure even to minute concentrations of the sensitizer.
- (12.5) Where it is reasonably practicable, exposure to sensitizers should be prevented. Where this cannot be achieved, exposure should be kept as low as is reasonably practicable and activities giving rise to short-term peak - concentrations should receive particular attention. As with other substances, the spread of contamination by sensitizers to other working areas should also be prevented, as far as is reasonably practicable.
- (12.6). The Sen notation (marked in the Tables with a Sen notation) has been assigned only to those sensitizers that may cause sensitization by inhalation. Remember that other substances not contained in these Tables can act as respiratory sensitizers.

### 13. *Other factors*

Working conditions, which impose additional stress on the body, such as exposure to ultra-violet radiation, high temperatures, pressures and humidity may increase the toxic response to a substance. In such cases, specialist advice may be necessary to evaluate the effects of these factors.

### 14. *Mixed exposures General*

- (14.1) The majority of OELs listed in Tables 1 and 2 are for single compounds or for substances containing a common element or radical, e.g. *tungsten and compounds, and isocyanides*. A few of the limits relate to substances commonly encountered as complex mixtures or compounds e.g. *white spirit, rubber fume, and welding fume*.
- (14.2) However, workers are frequently subjected to other mixed exposures involving solids, liquids, aerosols or gases. These exposures can arise as a result of work with materials containing a mixture of substances, or from work with several individual substances, simultaneously or successively, in a work shift.

- (14.3) Mixed exposures require careful assessment of their health effects and the appropriateness of control standards. The following paragraphs provide a brief summary of the advice on the application of exposure limits in these circumstances. In all cases of doubt, specialist advice should be sought.

## 15 *Effects of mixed exposures*

- (15.1) The ways in which the constituent substances of a mixed exposure interact vary considerably. Some mixed exposures involve substances that act on different body tissues or organs, or by different toxicological mechanisms, these various effects being independent of each other.
- (15.2) Other mixtures will include substances that act on the same organs, or by similar mechanisms, so that the effects reinforce each other and the substances are additive in their effect. In some cases the overall effect is considerably greater than the sum of the individual effects and the system is synergistic. This may arise from mutual enhancement of the effects of the constituents or because one substance potentiates another, causing it to act in a way which it would not do alone.

## 16 *Assessment and control*

- (16.1) With all types of mixed exposures, it is essential that assessments be based on the concentrations of each of the constituents in air to which workers are exposed. Depending on the nature of the constituents and the circumstances of use, the relative concentrations of the constituents in air may differ considerably from those in the liquid or solid source material. The composition of the bulk material should not be relied on for assessment unless there is good evidence for doing so.
- (16.2) Where mixed exposure occurs, the first step is to ensure adequate control of exposure for each individual substance. However, the nature and amount of the other substances in a mixture can influence the level to which it is reasonable practicable to reduce exposure to a substance subject to an OEL-CL.

(16.3) When limits for specific mixtures have been established, they should be used only where they are applicable, and in addition to any relevant individual limits. They should not be extended to inappropriate situations. It is then necessary to assess whether further control is needed to counteract any increased risk from the substances acting in conjunction.

(16.4) Expert assessments for some particular mixed exposures may be available and can be used as guidelines in similar cases. In other cases, close examination of the toxicological data will be necessary to determine which of the main types of interaction (if any) are likely for the particular combination of substances concerned.

(16.5) The various types should be considered in the following order:

*16.5.1 Synergistic substances:*

Known cases of synergism and potentiation are considerably less common than the other types of behaviour in mixed exposures. However, they are the most serious in their effects and require the most strict control. They are also the most difficult to assess and wherever there is reason to suspect such interaction, specialist advice should be obtained;

*16.5.2 Additive substances:*

Where there is reason to believe that the effects of the constituents are additive, and where the exposure limits are based on the same health effects, the mixed exposure should be assessed by means of the formula

$$C_1/L_1 + C_2/L_2 + C_3/L_3 \dots > 1$$

where  $C_1$ ,  $C_2$ , etc are the time-weighted average (TWA) concentrations of constituents in air and  $L_1$ ,  $L_2$ , etc are the corresponding exposure limits. The use of this formula is only applicable where the additive substances have been assigned OELs, and  $L_1$ ,  $L_2$ , etc. relate to the same reference period in the list of approved OELs. Where the sum of the  $C/L$  fractions does not exceed one, the exposure is considered not to exceed the OELs. If one of the constituents has been assigned an OEL-CL, then the additive effect should be taken into account in deciding the extent to which it is reasonably practicable to further reduce exposure; and

*16.5.3 Independent substances:*

Where no synergistic or additive effects are known or considered likely, the constituents can be regarded as acting independently. It is then sufficient to ensure compliance with each of the OELs individually.

(16.6) The above steps provide basic protocol for assessment of mixed exposures. It is open to persons responsible for control of exposure to treat all nonsynergistic systems as though they were additive. This avoids the need to distinguish additive and independent systems and can be regarded as the more prudent course, particularly where the toxicity data are scarce or difficult to assess.

## 17 *Monitoring mixed exposure*

(17.1) The number of components of a mixed exposure, for which routine air monitoring is required, can be reduced if their relative concentrations can be shown to be constant.

(17.2) This involves the selection of a key or marker, which may be one of the constituents, as a measure of the total contamination. Exposure to the marker is controlled at a level selected so that exposures to all components will be controlled in accordance with the criteria in paragraphs 16.5.1 and 16.5.2.

(17.3) However, if one of the components has been assigned an OEL-CL, the level of the exposure to that substance should always be reduced as far as is reasonably practicable.

(17.4) If this approach is to be used, it should take place under the guidance of suitable specialist advice.

(17.5) Rule 16 imposes a duty on the employer to monitor the exposure of employees to substances hazardous to health.

## 18 *Complicating factors*

18.1. Several factors that complicate the assessment and control of exposure to individual substances will also affect cases of mixed exposures and will require similar special consideration. Such factors include-

*18.1.1* exposure to a substance for which there is no established limit or for which an OEL-CL has been set;

*18.1.2* the relevance of factors such as alcohol, medication, smoking and additional stresses;

18.1.3 exposure of the skin to one or more substances that can be absorbed by this route, as well as by inhalation; and

18.1.4 substances in mixture may mutually affect the extent of their absorption, as well as their health effects, at a given level of exposure.
